Areas of Activities

Agro-food manufacturing

Space application to agriculture and environmental management

Other sectors relevant to the thematic focus of the event

Business Request

supplier/producer of animal feed and ingredients, logistic services for distribution

Lambers-Seghers Belgium is an independent SME which produces compound feeds for the most important farm animal

species (ruminants, pigs, chickens and horses), with the largest share of the total volume of feed production (approx. 120 000 tons/year) attributed to pig feeds. The company mainly delivers feeds to independent farmers and has a strong reputation in customer support, e.g. feed formulas are easily adapted to specific farms' needs. Its facilities include machinery and logistic to produce small amounts of feed. The company is also involved in projects aiming at creating added value in meat production. A special branch is horsefeed (branch name Horsemolen), herefore we are looking for distributors

At CMN Antwerp, we approach each client individually. 'Tailormade Logistic Solutions' is not an empty slogan, but a way of doing business. Service and quality are the two pillars on which our company is built. We Choose to work in partnerships with our clients so we can help them further develop their business. Therefore, dialogue is very important and we fully invest our time in being a trustworthy conversational partner.

Our Services:

- Warehousing
- Handling
- Transport
- Import / Export

Agro Waasland, is a supplier of ingredients for feed production, all kinds of ingredients or premixes. we also have the distribution of Aleurone a product of Cargill, a new ingredient, by product of wheat special for horses We are selling also dried taxus. We collect the green taxus and dry them in our warehouse, with a special drier for this application.

Cooperation Offered

1. Manufacturing agreement

Business Offer

Aleurone - Supplement for horsefeed

Aleurone consists of a single cell layer located between the endosperm and the seed coat of the wheat kernel. It remains attached to the bran fraction after conventional milling techniques have been applied. Highly effective milling and dry-fractionation techniques have been developed to separate the aleurone from the bran fraction (28,29,30). Depending on the applied fractionation technique, aleurone is available in different purity forms, aleurone Standard Preparation 1 (ASP-01) or the more purified more expensive form ASP-02.

Aleurone contains several components, which are embedded in an arabinoxylan matrix (31). The arabinoxylan, which is the main component of the wheat aleurone cell wall, represents the fibre fraction in the aleurone on one hand, and on

the other hand is the matrix to or in which several different aleurone components either are bound or embedded. Studies report beneficial effects of aleurone in 5 main areas: reduction of oxidative stress (11,13,32,33), positive immunomodulatory effects (18), energy management (34,35,36,37,38), digestive health (5,12,39,40,41,42) and vitamin and mineral storage (7,8). Aleurone consists of several different fractions, each of which can be expected to be partly responsible for the reported beneficial effects. To provide the necessary background to some of the bioanalytical endpoints used in the different trials, an overview of these fractions is given.
